

## MoultMend (TM) – Mini Guide: Post-Moult Support for Tarantulas

### Why Post-Moult Care Matters:

Tarantulas are at their most vulnerable immediately after a moult. Their new exoskeleton is soft, and hydration is critical for a full and healthy recovery. Improper support during this stage can lead to deformities, lethargy, or even death.

### What is MoultMend?

MoultMend is a liquid supplement designed to provide hydration, immune support, and recovery-boosting compounds specifically tailored for tarantulas. It combines natural ingredients like glycerine, amino acids, beta-glucans, and chamomile to support a smooth post-moult transition.

### How to Use:

- Add 1–2 drops to your tarantula's water dish weekly for 2 weeks after moulting.
- For advanced keepers: apply 1 drop near the chelicerae or on the edge of the burrow with a sterile tool.
- Ensure good humidity and minimal disturbance during this recovery period.

### Safety & Best Practices:

- Use only as directed. Do not exceed the recommended amount.
- Never apply directly to the tarantula's body.
- Not for human or other animal use.
- Store in a cool, dark place away from children and pets.

### Top Tips for Post-Moult Success:

- Always provide fresh water and proper humidity levels.
- Avoid feeding until fangs have fully darkened and hardened (typically 5–10 days).
- Observe from a distance and keep handling to an absolute minimum.
- Record moult dates to help track each spider's cycle.
